

IN THE CLAIMS:

The following is a complete listing of the claims and replaces all earlier listings and all earlier versions.

- Sub E1
cont
- D /
1. (Canceled).
 2. (Currently Amended) The apparatus according to ~~one of claims~~ claim 6 or claim 7, wherein said comparison means includes computation means for computing degree of similarity between the scene-change frame and the image that has been designated by said designation means, and
wherein said scene extraction means extracts the scene corresponding to said image based upon results of computation performed by said computation means.
 3. and 4. (Canceled)
 5. (Currently Amended) The apparatus according to ~~one of claims~~ claim 6 or claim 7, wherein said designating means designates a pattern image that corresponds to any of a leading, intermediate or final frame of a scene that is the object of a search.
 6. (Currently Amended) An image processing apparatus for processing a moving picture having ~~screen-change~~ scene-change information, comprising:

designating means for designating an image that corresponds to a scene that is the object of a search, ~~wherein said designating means is capable of designating the number of scenes to be extracted~~ and the number of scenes included in a moving picture;

comparison means for comparing a scene-change frame, ~~which is obtained by referring to the scene-change information [[and]]~~ with the image ~~that has been~~ designated by said designation means;

scene extraction means for extracting a scene from the number of scenes designated by said designation means, that corresponds to the image based upon a result of the comparison performed by said comparison means; and

output means for ~~editing scenes that have been~~ combining each of the moving pictures extracted by said scene extraction means ~~and combining these extracted scenes~~ into a single moving picture.

7. (Currently Amended) An image processing apparatus for processing a moving picture having ~~screen-change~~ scene-change information, comprising:

designating means for designating an image that corresponds to a scene that is the object of a search, ~~wherein said designating means is capable of designating~~ and time length of a scene to be extracted;

comparison means for comparing a scene-change frame, ~~which is obtained by referring to the scene-change information, [[and]]~~ with the image ~~that has been~~ designated by said designation means;

scene extraction means for extracting a ~~scene from~~ moving pictures,
each of which has scenes of the time length of scenes and includes a scene corresponding to
the image designated by designation means, ~~that corresponds to the image~~ based upon a
result of the comparison performed by said comparison means; and

output means for ~~editing scenes that have been~~ combining each of
the moving pictures extracted by said scene extraction means ~~and combining these~~
~~extracted scenes~~ into a single moving picture.

8. (Previously Presented) The apparatus according to claim 6, wherein
said designating means is capable of designating the number of scenes to be extracted with
regard to frames prior to and with regard to frames on and after a frame corresponding to
the pattern image.

9. (Previously Presented) The apparatus according to claim 7, wherein
said designating means is capable of designating the time of a scene to be extracted with
regard to frames prior to and with regard to frames on and after a frame corresponding to
the pattern image.

10. (Canceled).

11. (Currently Amended) The method according to ~~one of claims~~ claim
15 or claim 16, wherein said comparison step includes a computation step, of computing

cont

degree of similarity between the scene-change frame and the image that has been designated in said designation step, and

wherein said scene extraction step includes extracting the scene corresponding to the image based upon results of computation performed in said computation step.

12. and 13. (Canceled).

14. (Currently Amended) The method according to ~~one of claims~~ claim 15 or claim 16, wherein said designating step includes designating a pattern image that corresponds to any of a leading, intermediate or final frame of a scene that is the object of a search.

15. (Previously Presented) An image processing method for processing a moving picture having screen-change information, comprising:

a designating step, of designating an image that corresponds to a scene that is the object of a search, wherein said designating step includes optionally designating the number of scenes to be extracted;

a comparison step, of comparing a scene-change frame, which is obtained by referring to the scene change information and the image that has been designated in said designation step;

a scene extraction step, of extracting a scene from the number of scenes designated in said designation step, that corresponds to the image based upon a result of the comparison performed in said comparison step; and

an output step, of editing scenes that have been extracted in said scene extraction step and combining these extracted scenes into a single moving picture.

16. (Previously Presented) An image processing method for processing a moving picture having screen-change information, comprising:

moving picture;

a designating step, of designating an image that corresponds to a scene that is the object of a search, wherein said designating step includes optionally designating time length of a scene to be extracted;

a comparison step, of comparing a scene-change frame, which is obtained by referring to the scene change information that has been stored in said storage step, and the image that has been designated in said designation step;

a scene extraction step, of extracting a scene from the number of scenes designated in said designation step, that corresponds to the image based upon a result of the comparison performed in said comparison step; and

an output step, of editing scenes that have been extracted in said scene extraction step and combining these extracted scenes into a single moving picture.

17. (Previously Presented) The method according to claim 15, wherein said designating step includes designating the number of scenes to be extracted with regard to frames prior to and with regard to frames on and after a frame corresponding to the pattern image.

E1
cont

18. (Previously Presented) The method according to claim 16, wherein said designating step includes designating the time of a scene to be extracted with regard to frames prior to and with regard to frames on and after a frame corresponding to the pattern image.

19. (Canceled).

20. (Previously Presented) A computer-readable memory storing program code of image processing for processing a moving picture having screen-change information, the memory including:

program code of a designating step, of designating an image that corresponds to a scene that is the object of a search, wherein said designating step includes optionally designating the number of scenes to be extracted;

program code of a comparison step, of comparing a scene-change frame, which is obtained by referring to the scene-change information, and the image that has been designated in said designation step;

program code of a scene extraction step, of extracting a scene from the number of scenes designated in said designation step, that corresponds to the image based upon result of the comparison performed in said comparison step; and

program code of an output step, of editing scenes that have been extracted in said scene extraction step and combining these extracted scenes into a single moving picture.

21. (Previously Presented) A computer-readable memory storing program code of image processing for processing a moving picture having screen-change information, the memory including:

program code of a designating step, of designating an image that corresponds to a scene that is the object of a search, wherein said designating step includes optionally designating the number of scenes to be extracted;

program code of a comparison step, of comparing a scene-change frame, which is obtained by referring to the scene-change information, and the image that has been designated in said designation step;

program code of a scene extraction step, of extracting a scene from the number of scenes designated in said designation step, that corresponds to the image based upon result of the comparison performed in said comparison step; and

program code of an output step, of editing scenes that have been extracted in said scene extraction step and combining these extracted scenes into a single moving picture.
